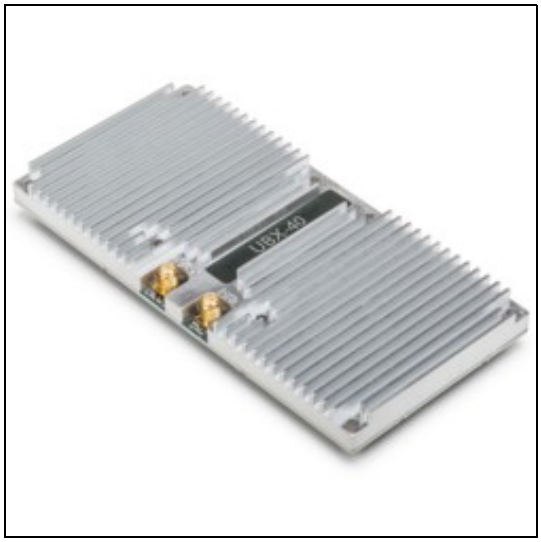
UBX

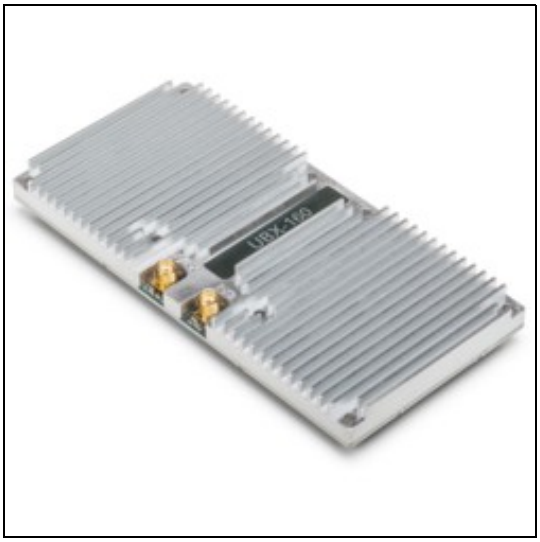
Contents

The UBX daughterboard is a full-duplex wideband transceiver that covers frequencies from 10 MHz to 6 GHz. Coherent and phase-aligned operation across multiple UBX daughterboards on USRP X Series motherboards enables users to explore MIMO and direction finding applications. The UBX daughterboard is supported by the USRP Hardware Driver? (UHD) software API for seamless integration into existing applications.

The UBX is capable of phase coherent operation, and therefore is suitable for MIMO and Phased Array applications, on the X Series. Additionally this capability is only available on the X Series devices.

- Frequency Range: 10 MHz - 6 GHz
- Versions: 40MHz / 160MHz
- RF shielding
- Full duplex operation with independent TX and RX frequencies
- Synthesizer synchronization for applications requiring coherent or phase-aligned operation, supported on USRP X Series motherboards only





- 2 quadrature frontends (1 transmit, 1 receive)
  - Defaults to direct conversion
  - Can be used in low IF mode through lo_offset with uhd::tune_request_t
- Independent receive and transmit LO's and synthesizers
  - Allows for full-duplex operation on different transmit and receive frequencies
  - Can be set to use Integer-N tuning for better spur performance with uhd::tune_request_t

Transmit: **TX/RX**

Receive: **TX/RX** or **RX2**

- **Frontend 0:** Complex baseband signal for selected antenna
- **Note:** The user may set the receive antenna to be TX/RX or RX2. However, when using a UBX board in full-duplex mode, the receive antenna will always be set to RX2, regardless of the settings.

- Transmit Gains: **PGA0**, Range: 0-31.5dB
- Receive Gains: **PGA0**, Range: 0-31.5dB

- UBX: 40 MHz, RX & TX
- UBX-160: 160 MHz, RX & TX

- **lo_locked:** boolean for LO lock state

- **LOCK**: Synthesizer Lock Detect
- **TX/RX TXD**: Transmitting on TX/RX antenna port
- **TX/RX RXD**: Receiving on TX/RX antenna port
- **RX2 RXD**: Receiving on RX2 antenna port

- 500 MHz - 1.5 GHz: 2 - 3 dB
- 1.5GHz - 6GHz: 4 - 10 dB

- 10 MHz - 6 GHz: 8 - 9 dBm

- 10 MHz - 6 GHz: < -30dBc

- 10 MHz - 3 GHz: 20 dBm
- 3 - 6 GHz: 8 - 20 dBm

- 10 - 500 MHz: 41 dBm
- 0.5 - 3 GHz: 36 dBm
- 3 - 6 GHz: 26 dBm - 36 dBm

- 10 MHz - 6 GHz: < -30 dBc

Note: The UBX 160 transmitter path has 160 MHz of bandwidth throughout the full frequency range of the device; the receiver path has 84 MHz of bandwidth for center frequencies from 10 MHz to 500 MHz.

- All RF Ports are matched to 50 Ohm with -10dB or better return loss generally. Detailed test is pending.

- The maximum input power for the UBX is -15 dBm.

The UBX daughterboard is capable of phase-synchronous operation, and is recommended for phase-coherent applications. The SBX and TwinRX daughterboards are also recommended for phase-coherent applications.

If you are operating the UBX at frequencies below 1 GHz and need phase synchronization, then it is necessary to select a 20 MHz daughterboard clock rate, instead of using the default 50 MHz rate. Note that this is only required for phase synchronization below 1 GHz. The UBX can still operate below 1 GHz without setting this lower daughterboard clock rate, but it will operate without any phase synchronization capability.

If you're using a UHD program, then you can specify the lower daughterboard clock rate on the command line of the program, with `--args="dboard_clock_rate=20e6"`.

If you're using the UHD API from a C++ program, then you can include `"dboard_clock_rate=20e6"` in the device arguments parameter when first invoking `multi_usrp::make()`.

If you're using GNU Radio, then you can add `"dboard_clock_rate=20e6"` to the `"Device Arguments"` field of the properties for the UHD Sink and UHD Source blocks.
